101 Discovery of similarity computations of search engines

77%

King-Kup Liu , Weiyi Meng , Clement Yu

Proceedings of the ninth international conference on Information and knowledge management November 2000

102 Learning to extract hierarchical information from semi-structured documents 77% Wai-Yip Lin , Wai Lam

Proceedings of the ninth international conference on Information and knowledge management November 2000

103 A unified framework for semantics and feature based relevance feedback in 77% image retrieval systems

Ye Lu, Chunhui Hu, Xingquan Zhu, HongJiang Zhang, Qiang Yang

Proceedings of the eighth ACM international conference on Multimedia October 2000

The relevance feedback approach to image retrieval is a powerful technique and has been an active research direction for the past few years. Various ad hoc parameter estimation techniques have been proposed for relevance feedback. In addition, methods that perform optimization on multi-level image content model have been formulated. However, these methods only perform relevance feedback on the low-level image features and fail to address the images' semantic content. In this paper, we propo ...

104 A prediction system for multimedia pre-fetching in Internet

77%

Zhong Su , Qiang Yang , Hong-Jiang Zhang

Proceedings of the eighth ACM international conference on Multimedia October 2000 The rapid development of Internet has resulted in more and more multimedia in Web content. However, due to the limitation in the bandwidth and huge size of the multimedia data, users always suffer from long time waiting. On the other hand, if we can predict the web object or page that the user most likely will view next while the user is viewing the current page, and pre-fetch the content, then the perceived network latency can be significantly reduced. In this paper, we present an n-gram b ...

114 Application of intelligent agent technology for managerial data analysis and

77%

🐴 mining

Ranjit Bose , Vijayan Sugumaran ACM SIGMIS Database January 1999

Volume 30 Issue 1

Data analysis and mining technologies help bring business intelligence into organizational decision support systems (DSS). While a myriad of data analysis and mining technologies are commercially available today, organizations are seeing a growing gap between powerful storage (data warehouse) systems and the business users' ability to analyze and act effectively on the information they contain. We contend that to narrow this gap effectively, a data analysis and mining environment is needed that ...

115 E-commerce over communicators

77%

Mona Singh , Anuj K. Jain , Munindar P. Singh

Proceedings of the first ACM conference on Electronic commerce November 1999

116 Content-based book recommending using learning for text categorization Raymond J. Mooney, Loriene Roy

77%

Proceedings of the fifth ACM conference on Digital libraries June 2000

Recommender systems improve access to relevant products and information by making personalized suggestions based on previous examples of a user's likes and dislikes. Most existing recommender systems use collaborative filtering methods that base recommendations on other users' preferences. By contrast, content-based methods use information about an item itself to make suggestions. This approach has the advantage of being able to recommend previously unrated items to users with unique interes ...

117 Defining logical domains in a web site

77%

Wen-Syan Li , Okan Kolak , Quoc Vu , Hajime Takano

Proceedings of the eleventh ACM on Hypertext and hypermedia May 2000

118 A multi-agent architecture for process management accommodates

77%

unexpected performance
John Debenham

Proceedings of the 2000 ACM symposium on Applied computing 2000 March 2000

119 A framework for expressing and combining preferences

77%

Rakesh Agrawal , Edward L. Wimmers

ACM SIGMOD Record , Proceedings of the 2000 ACM SIGMOD international conference on Management of data May 2000

Volume 29 Issue 2

The advent of the World Wide Web has created an explosion in the available on-line information. As the range of potential choices expand, the time and effort required to sort through them also expands. We propose a formal framework for expressing and combining user preferences to address this problem. Preferences can be used to focus search queries and to order the search results. A preference is expressed by the user for an entity which is described by a set of named fields; each field can ...

120 Eddies

77%

Ron Avnur , Joseph M. Hellerstein

ACM SIGMOD Record , Proceedings of the 2000 ACM SIGMOD international conference on Management of data May 2000

Volume 29 Issue 2

http://portal.acm.org/results.cfm?query=query%20and%20internet%20and%20users%20and%20r... Page 4 of 4

In large federated and shared-nothing databases, resources can exhibit widely fluctuating characteristics. Assumptions made at the time a query is submitted will rarely hold throughout the duration of query processing. As a result, traditional static query optimization and execution techniques are ineffective in these environments. In this paper we introduce a query processing mechanism called an eddy, which continuously reorders operators in a query plan as it ru ...
